

FISHING TOOLS

DOWNHOLE

NOV® Downhole is the largest independent downhole tool and equipment provider in the world. We have the expertise to optimize BHA selection and performance, supporting over 150 locations in more than 80 countries.

Our complete range of solutions for the bottom hole assembly and related equipment includes:

- 7 Drill Bits**
- 7 Drilling Motors**
- 7 Borehole Enlargement**
- 7 Drilling Tools and Products**
- 7 Coring Services**
- 7 Fishing Tools**
- 7 Intervention and Completion Tools**
- 7 Service Equipment**
- 7 Advanced Drilling Solutions**

We take pride in delivering superior performance and reliability. Our objective is to exceed our customers' expectations, improve their economics and be an integral part of their strategies.

NOV Downhole OfferingsPage 51

Intervention, Retrieval, and Recovery

NOV Downhole is the manufacturer of Bowen® Fishing Tools, the world's most respected and reliable fishing tool products in the oil and gas industry for over 85 years. Fishing Tools are utilized in two types of operations.

1. **Well Intervention** – the operation of servicing an under-performing well in order to increase its production
2. **Fishing** – the operation of recovering an object that is stuck, damaged, or lost in the wellbore

NOV Downhole provides a vast range of fishing tools that have become industry standards. The comprehensive list of products includes catch tools, fishing stroking tools such as jars, intensifiers, and bumper subs, junk retrieval tools, milling and cutting tools, as well as repair and remedial tools. We lead the industry in terms of the size and diversity of our fleet and our ability to provide and service tools at a global level.

Each fishing tool is engineered to perform a specific operation. Since several fishing tools are utilized to make a fishing bottom hole assembly, each tool enhances the performance of the others to provide the most effective solution for all types of well intervention and fishing operations.

NOV Downhole's Bowen Line of Fishing Tools:

- ▮ External catch fishing tools
- ▮ Internal catch fishing tools
- ▮ Junk retrieval fishing tools
- ▮ Milling and cutting tools
- ▮ Accessory tools
- ▮ Repair and remedial tools

NOV Downhole offers a computer-based Fishing Jar Placement Program that determines the optimum jar placement in the fishing string to maximize the energy of the jarring impact and impulse. This successful, field-proven placement program compensates for the effects of hole angle, hole curvature, and frictional drag making it applicable for straight, directional, and horizontal hole analysis.

Fishing Tools

External Catch

Fishing tools that engage the fish on its outer diameter. These tools help you recover equipment downhole by using a grapple or by threading directly to its outside surface.

Internal Catch

Fishing tools that engage the fish in its inner diameter. Similar to External Catch Tools, this is achieved by a grapple or by threading directly to the fish's inside surface.

Junk Catch

Fishing tools used to remove debris, also known as "junk", from the wellbore. Magnets and junk baskets are ideal when retrieving a fish that is broken into pieces or has an irregular shape.

Milling and Cutting

Fishing tools used to mill or cut objects downhole for a specific reason. Whether you are milling up a fish that could not be retrieved to surface, cutting casing or tubing in an intervention operation, or performing a washing over procedure, NOV Downhole has the tools for the job.

Accessory Tools

NOV Downhole offers a variety of tools that enhance the fishing operation. Bumper subs provide you that extra movement in the drillstring when finding the top of the fish, fishing jars create the impact and impulse force to free the stuck fish, and our intensifiers are run in conjunction with the fishing jar to increase the jarring impact.

Remedial and Repair

Scrapers are used to clean the casing's inside wall, rollers restore the the inner diameter of casing and tubing to their normal inside diameter and roundness, and patches form a permanent sealed connection between two strings of tubing or casing.

Engineering Services

NOV Downhole provides customized solutions to your specific application. When a special tool is required, our experienced engineering staff is available to evaluate your application and provide a specific and reliable solution.

Series 150 Overshots

Bowen Series 150 Releasing and Circulating Overshots

The **NOV Downhole Bowen Series 150 Releasing and Circulating Overshot** is the strongest tool available to externally engage, pack-off, and pull a fish. The basic simplicity and rugged construction with which it is designed have made it the standard of all external catch fishing tools.

Construction

The Bowen Series 150 Releasing and Circulating Overshot is composed of three outside parts: the Top Sub, Bowl, and Guide. The Basic Overshot may be dressed with either of two sets of internal parts, depending on whether the fish to be caught is near maximum size for the particular overshot.

If the fish diameter is near the maximum catch of the Overshot, a Spiral Grapple, Spiral Grapple Control, and Type "A" Packer are used. If the fish diameter is considerably below maximum catch size (usually $\frac{1}{2}$ ") a Basket Grapple and a Mill Control Packer are used.

Basket Grapple

Basket Grapple with Long Catch Stop

Bowen Series 150 Releasing and Circulating Overshot with Basket Grapple

Gripping and Releasing Mechanism

The Bowl of the Overshot is designed with helically tapered spiral section on its inside diameter. The gripping member (Spiral Grapple or Basket Grapple), is fitted into this section. When an upward pull is exerted against a fish, an expansion strain is spread evenly over a long section of the bowl and the compression strain is spread evenly over a long section of the fish. No damage or distortion occurs to either the fish or the Overshot. This design permits a far stronger tool with a smaller outside diameter than is possible with an overshot that employs a single tapered section which supports slips.

Inner Seal

A Spiral Grapple is formed as a left-hand helix with a tapered exterior to conform with the helically tapered section in the Bowl. Its interior is wickered for engagement with the fish.

A Basket Grapple is an expandable cylinder with a tapered exterior to conform to the helically tapered section in the Bowl. Its interior is wickered for engagement with the fish. Two types of Basket Grapple are available to meet the need for catching various types of fish.

Basket Grapple Mill Control Packer

The Basket Grapple with Long Catch Stop has an internal shoulder located at the upper end, to stop the fish in the best catch position. It is designed to stop and catch collars and tool joints, with sufficient length left below the Grapple to allow the joint to be packed-off with a Basket Control Packer. The Basket Grapple with Short Catch Stop (not shown) has a double set of wickers of two different internal diameters. It is used to stop and catch a coupling with a ruptured piece of pipe engaged in its upper end. The upper set of wickers will catch the ruptured pipe and act as a stop against the coupling, while the lower set of wickers will catch the coupling.

Grapple Controls are of two types: Spiral Grapple Controls are used with Spiral Grapples; Basket Controls are used with Basket Grapples. Grapple Controls are used as a special key to allow the Grapple to move up and down during operation while simultaneously transmitting full torque from the Grapple to the Bowl.

Outer Seal

Spiral Grapple Controls are always plain; Basket Grapple Controls may be either plain or include a Packoff. In addition to the Packoff, mill teeth are included. See Packoff Mechanism in this catalog for a complete explanation.

Series 150 Overshots

In operation, the Overshot functions in the same manner, whether dressed with Spiral Grapple parts or Basket Grapple parts.

During the engaging operation, as the Overshot is rotated to the right and lowered, the Grapple will expand when the fish is engaged, allowing the fish to enter the Grapple. Thereafter, with rotation stopped and upward pull exerted, the Grapple is contacted by the tapers in the Bowl and its deep wickers grip the fish firmly.

During the releasing operation, a sharp downward bump places the larger portion of the Bowl tapers opposite the Grapple, breaking the hold. Thereafter, when the Overshot is rotated to the right and slowly elevated, the wickers will unscrew the Grapple off the fish.

The fact that Bowen Releasing and Circulating Overshots require right-hand rotation only, both during engaging and releasing operation, is extremely important. This feature eliminates the dangers that are present when it is necessary to rotate the string in a left-hand direction.

Pack-Off Mechanism

The type of Pack-off used depends on how the Overshot is dressed and the operators' choice. When the Overshot is dressed with a Spiral Grapple, a Type "A" Packer is used. It seals at its O.D. against the inside of the Bowl. It has an internal lip that seals around the fish. Each Type "A" Packer is designed to packoff a specific size. A Type "A" Packer should be ordered for each size Spiral Grapple.

Control Packers are used when the Overshot is dressed with a Basket Grapple. Control Packers are standard with a Type "R" (Replaceable) Packer. The patented Double Lip Packer provides greater sealing ability and reduces the chance of seal damage during fish engagement. The outer seal is also replaceable; this allows for field replacement of either seal. The Mill Control Packer is used when light dressing is required prior to fish engagement.

NOTE: Only one control can be installed in the overshot assembly at a time. Control Packers are manufactured for a specific size. One should be ordered to match each basket grapple size that has been ordered.

Plain Controls are used when no packoff is required. They are installed in the same location as the Control Packer.

NOTE: The tables on the following pages list all available controls. Refer to those tables for the proper part number.

Operation: Engaging and Pulling the Fish

Connect the Overshot to the fishing string and run it in the hole. As the top of the fish is reached, slowly rotate the fishing string to the right and gradually lower the Overshot over the fish. Allow the right-hand torque to slack out of the fishing string, and pull on the fish by elevating the fishing string. If the fish does not come, start the circulating pumps and maintain a heavy upward strain while fluid is forced through the fish.

Releasing From the Fish

Drop the weight of the fishing string heavily against the Overshot, then simultaneously rotate to the right and slowly elevate the fishing string until the Overshot is clear of the fish. To release from a recovered fish, follow the same procedure while holding fish below the Overshot.

Overshot Accessories

The more commonly used accessories for Bowen Series 150 Overshots are Extension Subs, Oversize Guides, Wall Hook Guides, Milling Shoes, and Lock Rings. These accessories are illustrated and listed beginning on page 10. Calculated strength data on all Bowen Series 150 Overshots are available on request.

Send for Bowen Technical Manual No. 1150 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Series 150 Releasing and Circulating Overshots.

Tools are listed in order of maximum catch size.

O-ring seals are normally furnished in sealed plastic bags of 10, 25, or 100 pieces each to prevent deterioration. Other quantities will be furnished in unsealed packages. Packing sets will always be furnished in sealed plastic bags.

Overshot Accessories

Bowen Itcoloy Mill Extensions

Overshot Mill Extension interiors are faced with Itcoloy to a size that will mill away a flared or jagged fish to enable it to pass up into and be engaged by the Grapple in the Bowl. Mill Extensions are installed between the Bowl and the standard, oversize or wallhook guides.

Bowen Itcoloy Mill Guides

Overshot **Itcoloy Mill Guide** interiors are faced with Itcoloy to a size that will mill away a flared or jagged fish to enable it to pass up into and be engaged by the Grapple in the Bowl. The Itcoloy Mill Guide is used in place of a standard or oversized Guide. They may be ordered using the Standard Guide number. Specify O.D. to be milled over and state, "Itcoloy Mill Guide."

Bowen Oversize Guides and Wall Hook Guides

If the hole size is so much greater than the fish size that it is possible for the Overshot to pass alongside the fish, an **Oversize Guide** or a **Wall Hook Guide** must be installed to insure alignment of the fish with the Overshot.

Impression Blocks and Extension Subs

Bowen Impression Blocks

NOV Downhole Bowen Impression Blocks, which consist of a soft lead insert in the lower end of a steel housing, are used in fishing operations. They are designed to enable the operator to determine the configuration of the top of the fish and to locate its position in the well bore. Its use enables the operator to more precisely assess the fishing conditions and select the proper tool or tools needed to successfully complete the fishing operation.

Operation

To use an NOV Downhole Bowen Impression Block: Lower the tool into the well on the lower end of a fishing string of pipe. After the Block contacts the upper end of the fish, the weight of the string is further lowered straight down (never rotate) against the fish which indents into the soft lead lower end of the Block. When the fishing string is withdrawn from the well, the impression in the lead will reveal the condition of the fish.

Available in two styles:

Solid Impression Block:

- Simple design
- Solid steel body with pin thread on top and cavity on the bottom to retain the lead
- Mild steel except for tools with Sucker Rod threads that will be heat treated
- Short fishing neck (still provides wrench space and fishing length)

Watercourse Impression Block:

- Watercourse through tool and to face of lead impression (available to wash off top of fish to get good impression)
- Longer fishing necks provide length for rework of threads
- Heat-treated material used on most sizes regardless of thread

Bowen Impression Blocks are available with or without watercourse.

Bowen Extension Subs

If a twist-off has left a fish whose upper end is un-engageable, an Extension Sub is installed between Top Sub and the Bowl of the Overshot. This will permit lowering of the Overshot over the fish far enough to insure a secure engagement and a perfect pack-off. Extension Subs with stops will be furnished on request.

Extensions can usually be furnished with a bore very near the maximum catch diameter of the overshot bowl. Some cannot be made as large as maximum, because it will cause a substantial loss of strength. When an Extension requires boring to near maximum catch size, the operator should consult Bowen on maximum allowable sizes and effects on strength. When ordering, specify overshot and O.D. if other than standard. Unless otherwise specified, Extension Subs will be furnished in a standard 36-inch length.

Series 10 Sucker Rod Overshots

Bowen Series 10 Sucker Rod Overshots

NOV Downhole Bowen Series 10 Releasing Sucker Rod Overshots are the best available tools for engaging and retrieving sucker rods, couplings, and similar items from inside tubing strings. Series 10 Overshots are available in sizes to engage up to 2 $\frac{5}{16}$ " O.D. inside of 2 $\frac{7}{8}$ " tubing and up to 1 $\frac{5}{8}$ " O.D. inside 2 $\frac{3}{8}$ " tubing.

Construction

The Bowen Series 10 Overshot consists of a Top Sub, a Bowl, a Spiral Grapple and a Control Guide. When a Basket Grapple is used in the Series 10 assembly, a Basket Grapple Control and a Plain Guide are required.

Operation

To engage & pull the fish: Connect the Overshot to the fishing string and run it in the hole and lower it slowly over the fish while rotating slowly to the right. Allow any twist to slack out of the fishing string and then pull on the fish by elevating the fishing string.

To release from the fish: Drop the weight of the fishing string heavily against the Overshot, then simultaneously rotate to the right and slowly elevate the fishing string until the Overshot is clear of the fish. To release from a recovered fish, follow the same procedure while holding the fish below the Overshot.

RECOMMENDED SPARE PARTS:

Spiral: 2 grapples, 1 control

Basket: 2 grapples, 1 grapple control

SPECIAL NOTES:

(1) Grapples available in $\frac{1}{16}$ " intervals.

FS (Full Strength) Engineered to withstand all pulling, torsional and jarring strain.

SFS (Semi Full Strength) Engineered for special hole conditions and maximum strength.

SH (Slim Hole) Engineered to withstand heavy pulling strains only.

Send for Bowen Technical Manual No. 1010 which includes complete descriptions of construction, operation, maintenance and listing for Bowen Series 10 Bowen Overshots.

Series 20 Overshots

Bowen Series 20 Short Catch Sucker Rod Overshots

NOV Downhole Bowen Series 20 Short Catch Sucker Rod Overshots are designed to catch sucker rods, couplings and the exposed portions of other items which are too short to be engaged by the Series 10 or other conventional overshots.

Construction

The Series 20 Overshot consists of a Top Sub, a Bowl, a Grapple Control, and a Basket Grapple. It differs from the Series 10 in that there is no Guide, and the Grapple Control is above the Basket Grapple, permitting the Basket Grapple to be placed at the lowest position in the Bowl.

Operation

Operation of the Series 20 Short Catch Overshot is identical to that of the Series 10 Overshot.

RECOMMENDED SPARE PARTS:

- (1) 2 Grapples for each size
- (2) 1 Control

SPECIAL NOTES:

- (1) Grapples available in $\frac{1}{16}$ " intervals.

FS (Full Strength) Engineered to withstand all pulling, torsional and jarring strain.

SFS (Semi Full Strength) Engineered for special hole conditions commensurate with maximum strength.

SH (Slim Hole) Engineered to withstand heavy pulling strains only.

Send for Bowen Technical Manual No. 1010 which includes complete descriptions of construction, operation, maintenance and parts listing for Bowen Series 20 Short Catch Sucker Rod Overshots.

Series 70 Overshots

Bowen Series 70 Short Catch Releasing Overshots

Series 70 Short Catch Releasing Overshots are specifically designed to engage the exposed portion of a fish too short to be engaged with conventional catch overshots and where conditions prevent lowering the overshot past the fish. This tool will firmly engage a very short fish.

Construction

This tool is simple and rugged. The four pieces comprising the assembly cannot be incorrectly assembled.

Operation

The operation of the Series 70 Short Catch Releasing Overshot is identical to that of the well known Series 150 Bowen Overshot: engagement is effected by slowly lowering the assembly over the fish while maintaining slow right hand rotation; release is accomplished by bumping down heavily and then slowly elevating the fishing string while simultaneously rotating slowly to the right.

RECOMMENDED SPARE PARTS:

- (1) 2 Basket Grapples, each catch size
- (2) 1 Basket Grapple Control

SPECIAL NOTES:

FS (Full Strength) Engineered to withstand all pulling, torsional and jarring strain.
SH (Slim Hole) Engineered to withstand heavy pulling strains only.

Send for Bowen Technical Manual No. 1070 which includes complete descriptions of construction, operation, maintenance and parts listing for Bowen Series 70 Short Catch Releasing Overshots.

Rotary Die Collars

Bowen Rotary Die Collars

Die Collars are simple, rugged, dependable external catch fishing tools.

Operation

Run the Die Collar in the hole to the top of the stuck fish. Apply less than one point of weight and rotate the die collar until the tapered threads have engaged the fish. Stop rotation and pull the fish from the hole.

Die Collars are furnished in two types: Type "A" and Type "B." Type "A" Die Collars have a smooth end on the large diameter end, the guide is integral with the die collar.

NOTE: Type "A" Die Collars also available with cut lip design.

Type "B" Die Collars have a threaded end on the large wicker diameter end so that an optional guide can be used to better adapt the die collar to changing hole conditions. Optional guides are furnished with plain or cut lip designs. All Die Collars are furnished with hardened wickers, designed to engage even the most difficult fish. The standard wickers offered are a plain, watertight, non-fluted design, if circulation is required below the stuck point. An optional fluted type wicker is also available, designed to flush out the cuttings while engaging the fish.

NOTE: No additional charge for fluted wickers.
Left-hand wickers and tool joint furnished on request.

Type B Die Collar with Lipped Guide

Type A Die Collar

Oversize Guide

Diameters A & B & Length C known:

$$\frac{12 \times (B - A)}{C} = \text{Taper per Foot (TPF)}$$

Diameters A & B known:

$$\frac{12 \times (B - A)}{\text{TPF}} = \text{Length C}$$

Diameter A & Length C known:

$$\frac{\text{TPF} \times C}{12} + A = \text{Diameter B}$$

Diameter B & Length C known:

$$B - \frac{\text{TPF} \times C}{12} = \text{Diameter A}$$

Large Wicker I.D. = "B" Diameter — The large wicker I.D. should be at least 1/2" larger than your known fish outside diameter.

Small Wicker I.D. = "A" Diameter — The small wicker I.D. should be at least 1/2" smaller than your known fish outside diameter. The small wicker diameter should never be less than 1 1/2" due to the boring and wickering operation during the manufacturing process.

Length of Wickers = "C" Length — The length of the wickers can be any length up to 24" long.

NOTE: Lengths longer than 24 inches require two-piece construction. Additional charges will be required for this type of construction.

Wall Thickness = "D" — Thickness at guide end of taper tap should never be less than 1/4".

Taper per Foot (TPF) = The standard taper per foot on all Die Collars, if not specified, will be 3/4" TPF. Never exceed 1" taper per foot. Tapers exceeding 1" TPF reduce the number of wickers which can engage the fish during a fishing operation.

NOTE: Tapers less than 3/4" TPF are used when the diameters selected cause the die collar to be too short.

Watercourse = All Rotary Die Collars are furnished with a circulation hole drilled through the center, providing the ordered connection was designed with a watercourse.

Tong Space = "E" Length — Tong space should be at least 9" on die collars. Add 1 1/2" of extra length per required recut of tool joint to the tong space area.

Rotary Taper Taps

Bowen Rotary Taper Taps

NOV Downhole Bowen Rotary Taper Taps are simple, rugged, dependable internal catch fishing tools.

Operation

Run the taper tap in the hole to the top of the stuck fish, Apply less than one point of weight, rotate the tap until the tapered threads have engaged the fish. Stop rotation and pull the fish from the hole.

Rotary Taper Taps are furnished in two types: Plain or Skirt type. Plain Taper Taps do not have a skirt thread provided on the shoulder. Skirt Type Taper Taps are threaded for a skirt. A skirt is used when the hole size is drastically different from the fish size. The taper tap can be dressed with a skirt or a skirt and oversize guide. This will allow for the taper tap to be guided into the fish more easily during the fishing operation.

NOTE: All skirt type taper taps are furnished with a thread protector. This will insure that the threads are not damaged if the taper tap is run in a fishing operation that does not require a skirt.

All NOV Dowhole Bowen Rotary Taper Taps are furnished with hardened wickers, designed to engage even the most difficult fish. The wickers are offered in a plain, water-tight, non-fluted design, if circulation is required below the stuck point, or a fluted type, designed to flush out the cuttings while engaging the fish.

NOTE: Non-fluted watertight wickers are furnished standard. Fluted-type wickers must be specified when ordered if required. Left hand wickers and tool joint furnished on request.

Large Wicker O.D. = "B" Diameter — The large wicker O.D. should be at least 1/2" larger than your known fish inside diameter.

Small Wicker O.D. = "A" Diameter — The small wicker O.D. should be at least 1/8" smaller than your known fish inside diameter. The small wicker diameter should never be less than a" due to depth of wickers required on the taper tap.

Length of Wickers = "C" Length — The length of the wickers can be any length up to 48" long.

NOTE: Lengths longer than 48 inches require two piece construction. Additional charges will be required for this type of construction.

Taper per Foot = The standard taper per foot on all Bowen Taper Taps, if not specified, will be 3/4" taper per foot (TPF). Never exceed 1" TPF. Tapers exceeding 1" TPF reduce the number of wickers which can engage the fish during a fishing operation. This could cause the taper tap to fail during an attempted fishing operation.

NOTE: Tapers less than 3/4" TPF are used when the diameters selected cause the taper tap to be too short.

Watercourse = All Rotary Taper Taps are furnished with a circulation hole drilled through the center, providing the small diameter is large enough to accommodate it. Taper taps that have a small diameter less than 1" cannot have a standard circulation hole. These taper taps must be furnished with a cross-drilled circulation port above the skirt thread or above the largest wicker diameter if not threaded for skirt.

Tong Space = "E" Length — Tong space should be at least 9" on taps that are not threaded for a skirt and 11" for a tap that will be threaded. Add 1 1/2" of extra length per required recut tool joint to the tong space area.

Send for Bowen Technical Manual No. 2800 which includes complete descriptions of construction, operation, and parts listing for Bowen Rotary Taper Taps.

For Taper Tap skirt information send for Bowen Technical Manual No. 2100 on Bowen Full Circle Releasing Spears. (Skirts are interchangeable.)

Itco-Type Releasing Spears

Bowen Itco-Type Releasing Spears

NOV Downhole Bowen Itco-Type Releasing Spears provide a dependable, inexpensive, and simple means of engaging a fish internally. These Spears assure positive engagement, easy release from the fish when desired, and easy re-engagement after the Spear has been released.

Construction

The Itco-Type Releasing Spear consists of a Mandrel, Grapple, Release Ring, and Nut. The Mandrel may be obtained in either a Flush Type or a Shoulder Type. Mandrel top connections are furnished to order. The Nut can be obtained as a plain bullnose guide or with a pin connection for the attachment of other tools below the Spear.

Assembly and Operation

To Assemble: Screw the Grapple onto the Mandrel from the lower end with a left-hand action. Slide the Release Ring on below the helical section of the Mandrel and make up the Nut to the Mandrel. Before running in, screw the Grapple down against the Release Ring as far as it will go by hand. In this position, the Grapple will compress inward and will not engage the pipe sufficiently to interfere with the tool being run in.

To Engage the Fish: When the Spear has reached the point of desired engagement with the fish, rotate sufficiently to move the Mandrel one full turn to the left. This turns the Mandrel down through the Grapple, placing the Grapple into the engaging position. A straight pull will then wedge the Grapple into positive engagement with the fish.

To Release: Bump down to break the freeze, then rotate two or three turns to the right. This moves the Mandrel up through the Grapple, forcing the Grapple against the Release Ring and putting the Spear in released position. A straight upward pull will then generally free the Spear; however, it is recommended that the Spear be rotated slowly to the right when coming out. The matching cams of the Release Ring and Nut constitute a safety device which resists freezing or jamming.

Send for Bowen Technical Manual No. 2300 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Itco-Type Releasing Spears.

Bowen Spear Pack-Off Assembly

Packoff Assemblies are available for most Bowen Itco Type Releasing Spears to pack-off all sizes of tubing, drill pipe and casing. The Packoff Assembly is attached to the Sub Type Nut below the Spear, where it packs-off the fish in order to circulate through the fish.

Optional Nuts

Optional Nuts available are: Mill Type to mill away burrs, Sub Type to connect and run other tools below the Spear, and Sidehill Type to center the spear in greatly oversize holes to assure entry of the Spear into the fish.

NOTE: To order optional nuts, use standard nut number with suffix; -A for Mill Type, -B for Sub Type and -C for Sidehill Type Nuts. Include O.D. of spear used with and connection if Sub Type.

Segment-Type Spear Grapples

Type F Stop Subs

The **Type F Stop Sub** is designed to be used with the Flush Mandrel Type Releasing Spear when use of a stop is required. It is installed in the box connection at the top of the Mandrel.

RECOMMENDED SPARE PARTS:
(1) 2 Grapples for each catch size

Type S Oversize Stop Rings

The Type S Oversize Stop Ring is used with the Type F Stop Sub when use of a larger stop is required. It is installed on the Stop Sub shoulder with set screws.

Bowen Segment-Type Spear Grapples

The **NOV Downhole Bowen Segment-Type Spear Grapple** is used to extend the catching ability beyond the range of a one piece grapple. This grapple consists of a Grapple Body, eight Grapple Segments, two Retainer Rings, six Ring Screws, six Ring Spacers, and Grapple Segment Screws. The helix of the Grapple Body matches that of the Spear Mandrel thereby making the action of the Spear the same as with a Standard Grapple.

Full-Circle Releasing Spears

Bowen Full-Circle Releasing Spears

NOV Downhole Bowen Full-Circle Releasing Spears offer many outstanding advantages for all fishing jobs where it is necessary to engage a fish internally. Secure engagement is assured by the Full Circle Slips. Positive Release is assured by the primary release mechanism, backed by the left-handed wickers on the Slips which allow the tool to be unscrewed from the fish using right-hand rotation.

These tools are versatile, a size being available for each tubing, drill pipe and casing size. The full complement of accessories available include Mill Type, Sub Type and Sidehill Type Nuts, Extensions, Safety Ring Pack-offs, and Skirts and Guides. Generous bores are provided through the tools to assure ample fluid flow to help remove cuttings and furnish lifting force to the fish.

RECOMMENDED SPARE PARTS:

- (1) 2 Sets of Slips for each size to be caught
- (2) 1 Unitizer and 2 Friction Retainers (or 2 Friction Block Assemblies)
- (3) 1 Stop
- (4) 1 Safety Ring for each size of Slips

NOTE: To order optional nuts, use standard nut number with suffix -A for mill type, -B for sub type and -C for sidehill type nuts. Include O.D. spear used with and connection, if sub type. Refer to page 21 for illustrations of optional nuts.

Send for Bowen Technical Manual No. 2100 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Full-Circle Releasing Spears.

Simplex Packer Retrievers

Bowen Simplex Packer Retrievers

NOV Downhole Bowen Simplex Packer Retrievers are internal engaging fishing tools designed to retrieve all types of "drillable" production packers in a single run. They are used in an assembly which consists of a retriever, stinger, mill shoe and bushing. A Bowen Simplex Packer Retriever has a top sub, mandrel, cage and bottom nut. The retriever is attached to the stinger which is long enough to extend through the packer, when the milling operation is started. The mill shoe must be of a length which will shroud the packer. A short mill shoe may be used with a piece of washpipe in place of the long mill shoe. Mill shoes are faced on the bottom and I.D. with Bowen Itcoloy (sintered tungsten carbide). They will not damage the well casing. On the bottom of the bushing there is a box connection for attaching the stinger and a pin connection for attaching the washpipe or long mill shoe. On top is a box string connection.

To operate, lower the assembly until the Bowen Simplex Packer Retriever passes through the bore of the packer. Continue lowering until the mill shoe contacts the packer's slips. Begin circulation and rotation, and mill away the slips and sealing element until the packer is free. Then cease rotation, elevate the string and the retriever will engage and retrieve the packer. At any time after the retriever enters the packer, it can be released by lowering a few inches, rotating 90° to the right and slowly elevating the string.

Smooth Bore Packer Retrievers

Bowen Smooth Bore Packer Retrievers

Designed for Engagement of Smooth I.D. Bores

National Oilwell Varco's **Bowen Smooth Bore Packer Retrievers** are designed to be directly connected to a packer mill and to engage a packer with a smooth ID. It allows for constant rotation while milling and remains in the engaged position to prevent the packer from falling if it breaks loose. It can transfer torque to the packer if required and can also be engaged and released multiple times if needed.

Operation

The operation of the retriever is simple. The grapple is locked to the grapple carrier in a manner that prevents rotation while still allowing up and down movement between the grapple and grapple carrier. The grapple carrier is free to rotate on the mandrel unless the teeth are engaged between the grapple carrier and nut. Only right hand rotation and movement up and down are required for complete operation of this tool.

Placing the Retriever

The retriever is placed far enough under the packer mill to locate the grapple inside of the bore to be caught before milling begins. The length of the stinger/extension between the packer mill and the retriever is varied to adjust the location of the tool.

Engaging the Packer

The milling assembly is run into the hole and the top of the packer located. Rotation should be ceased or slowed to a minimum while entering the packer bore. As the retriever enters the bore, the grapple and grapple carrier will slide up to the shoulder on the mandrel. Additional downward force will compress the grapple to enter the bore. The entire assembly may now be lowered until the mill contacts the top of the packer. Once the grapple is positioned in the bore to be engaged, rotation may be resumed.

Milling the Packer

The packer may be milled at any speed and weight. The retriever will travel downward with the mill while staying in the engaged position should the packer break loose and fall.

Retrieving the Packer and Tubing

Engagement of the grapple may be tested at any time during the milling operation by stopping rotation and lifting the entire assembly. After the packer has broken free, it is recommended that rotation be ceased. Upward movement will engage the grapple. It is best if the entire assembly can be pulled out of the hole without any right hand rotation to prevent the risk of the retriever releasing from the packer.

Releasing the Packer

At any point during the milling operation, the grapple may be released by first setting down load and then lifting upward slightly while rotating to the right. The grapple will unscrew by an amount equal to the lead of the wickers for each rotation.

Safety Joints

Bowen Coarse Thread Safety Joints

The **NOV Downhole Bowen Coarse Thread Safety Joint** allows quick release from drilling, fishing, testing, washover, or tubing strings should they become stuck, leaving a minimum of pipe in the hole, thereby reducing the problems of fishing or sidetracking. The new design is simple, eliminating the need of a release ring mechanism and lengthy disengagement procedures.

The Safety Joint has a rugged coarse thread design which will not loosen or wedge during operation. Once in the string the Safety Joint is resistant to vibration, heavy loads, and left or right-hand torque. The tool will disengage by simple left-hand rotation at approximately 40% of the tool's right-hand make-up torque.

O-ring packers above and below threads seal against internal and external fluid pressures. Both packers are rated for all normal pump pressures in continuous service.

The Safety Joint is available in a full range of sizes, types, lengths, etc. Bowen will manufacture the tool to fit customer's exact requirements. Three specific types are available as follows:

- Drill Pipe Safety Joints with tool joint connections, O.D. and I.D. correspond to those of tool joints.
- Tubing Safety Joints (not shown) with tubing connections: O.D. same as O.D. of coupling; I.D. same as I.D. of tubing string.
- Washover Safety Joints (not shown) run between drill pipe and washover string, have tool joint box in Safety Joint Pin Section, and washover string pin on Safety Joint Box Section. Diameters conform to those in use on washover pipe.

Bowen Coarse Thread Drill Pipe Safety Joint

Fishing Bumper Subs

Bowen Fishing Bumper Subs

A fishing string made up properly always includes a dependable Bumper Sub. These Bumper Subs may also be used as a feed-off tool when using the "predetermined weight" method to cut tubing or casing. This method is described in Bowen Instruction Manual No. 5600.

Construction

The **NOV Downhole Bowen Fishing Bumper Sub** is simple yet rugged. It is composed of only five primary parts and a double seal assembly. The hexagon shaped mandrel slides in a similar shaped mandrel body to provide continuous torque capability. The standard 20-inch stroke of these tools is optimum for most purposes, but longer strokes will be furnished as required, on special order. Full circulation may be maintained through the bores of the tools at all times. When preferred by the operator, knockers with Chevron packing can be furnished at extra cost.

Operation

Bowen Fishing Bumper Subs are suited for all fishing operations. They will bump down, jar up, or help disengage a fish after retrieval.

They are easy to operate and maintain, and are available in sizes to match all sizes of fishing strings, drill pipe, or tubing.

NOTE: Standard stroke for bumper subs is 20 inches. Strokes up to 60 inches furnished. Specifications and prices on request.

RECOMMENDED SPARE PARTS:

- (1) 8 Non-Extrusion Rings
- (2) 8 Seal Protector Rings
- (3) 16 Klocker Seals
- (4) 4 Set Screws

Send for Bowen Technical Manual No. 4460 which includes complete descriptions of construction, operation, maintenance, and parts listings for Bowen Fishing Bumper Subs.

Bowen Fishing Bumper Sub

Lubricated Fishing Bumper Subs

Bowen Lubricated Fishing Bumper Subs

NOV Downhole Bowen Lubricated Fishing Bumper Subs are engineered to withstand sustained bumping action in severe fishing and deep workover operations.

The tools permit a 10-inch to 18-inch vertical stroke, either upward or downward, that is always available whether rotating or not. Tools with strokes greater than 18 inches up to 60 inches are available on request at extra cost.

A fishing string made up properly always includes a dependable Bumper Sub. This is absolutely mandatory when the fishing job is severe, or includes tools which require sharp bumping action to actuate or release them. No tool, other than Bowen's Lubricated Fishing Bumper Sub, can better meet these demands.

NOTE: Mandrel body wipers available on request.

RECOMMENDED SPARE PARTS:

- (1) Service Kit
- (2) 6 Seal Packing Sets
- (3) 4 Middle Body Fill Plugs
- (4) 4 Mandrel Body Fill Plugs
- (5) 16 Main Mandrel Non-Extrusion Rings
- (6) 16 Main Mandrel Seal Protector Rings
- (7) 1 Seal Ring Setting Tool

Send for Bowen Technical Manual No. 4445 which completely describes the construction, operation, and maintenance of Bowen Lubricated Fishing Bumper Subs.

Lubricated Fishing Bumper Sub

Balanced Bumper Subs

Bowen Balanced Bumper Subs

The **NOV Downhole Bowen Balanced Bumper Sub** is engineered to withstand sustained bumping action in fishing, light milling, and workover operations. The tool is designed to permit a 10" to 18" vertical stroke, either upward or downward.

This stroke is always available to the operator, whether rotating or not. Strokes greater than 18" can be furnished on special request. The Bowen Balanced Bumper Sub will transmit full torque at all times during rotation and bumping operations. Adequate striking surfaces are provided at the limits of the free movement to produce the great impact so necessary to get high quality, positive bumping action in either direction. Specially designed rugged splines provide a source of continuous torque transmission. These splines are always in engagement, whether bumping or not.

The bores permit full circulation at all times. The balance feature which is composed of the Floater in a suitable Floater Body surrounding the Washpipe, serves a double purpose. It balances the external pressure with the circulating fluid pressure; and it serves to allow for volumetric expansion of the tool working fluid, due to temperature. This results in freer operation under extreme conditions of pressure differential or of temperature, or both. It also results in longer tool life.

Under such adverse conditions the Bowen Balanced Bumper Sub will perform where other tools fail.

The Bowen Balanced Bumper Sub is especially well-suited for use in deep, severe fishing operations, or for light milling or coring operations. It permits an immediate bumping action to prevent cuttings and cavings from settling and wedging the drilling or fishing string.

The Bowen Balanced Bumper Sub will free drill pipe and reamers, drill collars, bits and other tools which have become stuck, lodged or keyseated. The tool can readily be used to bump repeatedly in either direction or to bump alternately up and down.

The Bowen Balanced Bumper Sub is an ideal tool to be used in coring operations. The bumping action is an effective way to break cores sharply and cleanly to permit easy removal when desired.

NOTE: Miscellaneous O-Ring Seals are normally furnished in sealed plastic bags of 10, 25, or 100 pieces each to prevent deterioration. Other quantities will be furnished in unsealed packages. Packing Sets, will always be furnished in sealed plastic bags.

RECOMMENDED SPARE PARTS:

- (1) 1 Service Kit
- (2) 6 Seal Packing Sets
- (3) 8 Middle Body Fill Plugs
- (4) 4 Mandrel Body Fill Plugs
- (5) 16 Main Mandrel Non-Extrusion Rings
- (6) 16 Main Mandrel Seal Protector Rings
- (7) 4 Mandrel Body Fill Plugs
- (8) 16 Floater O.D. Non-Extrusion Rings
- (9) 16 Floater O.D. Seal Protector Rings
- (10) 16 Floater I.D. Non-Extrusion Rings
- (11) 16 Floater I.D. Seal Protector Rings
- (12) 1 Main Mandrel Setting Tool
- (13) 1 Floater Setting Tool

Send for Bowen® Technical Manual No. 4455 which completely describes the construction, operation, and maintenance of Balanced Bumper Subs.

Type Z™ Oil Jars

Bowen Type Z Oil Jars

Sold Export Only

The **NOV Downhole Bowen Type Z Oil Jar** is the result of years of continuous improvement based on actual field use. It is a straight-pull operated Jar. This Jar is simple to assemble and easy to use. The Bowen Type Z Oil Jar is used for fishing, testing, coring, reaming, light drilling, side tracking, and washover operations.

Each blow can be controlled positively by the operator to deliver a very light blow or a blow of very heavy impact. Full circulation may be maintained throughout the tool for effective flushing. Full torque may be utilized in either direction and is at all times by means of heavy duty spines which are continuously in engagement.

Only straight pull is required to operate the Bowen Type Z Oil Jar, and successive blows can be struck as often as the operator can slack off and raise the running string.

The Bowen Oil Jar should be tested in the Bowen Jar Tester prior to operation.

RECOMMENDED SPARE PARTS:

- (1) 1 Service Kit
- (2) 1 Washpipe
- (3) 2 Piston Assemblies
- (4) 16 Non-Extrusion Rings
- (5) 16 Seal Protector Rings

Super Fishing Jars

Bowen Super Fishing Jars

Sold Export Only

The patented **NOV Downhole Bowen Super Fishing Jar** is a straight-pull operated jar which employs a patented combination of proven principles of hydraulics and mechanics. This jar is simple to assemble and its unique design allows for easy operation.

Operation

No setting or adjustment is required before going in the hole or after the fish has been engaged. The Bowen Super Fishing Jar is designed to permit the operator to easily and simply control the intensity of the jarring blow within a wide range, from a very light impact to a blow of very high impact. The unique impact control of the Bowen Super Fishing Jar is made possible by the metering action of the patented cone assembly. As pull is applied to the jar, oil is forced from one side of the cone to the other through a metering slot. By being forced through a restricted passage, the fluid flow is retarded in such a manner that the stroke is delayed until the operator has ample time to take the necessary stretch in the running string (and Super Intensifier when it is used) to strike a blow of given impact.

Another important feature of the Super Fishing Jar is the ease of closing or resetting. Only sufficient weight to overcome friction is required. Closing is free of any danger of causing damage to the tool, since the metering action does not take place during resetting. During resetting, large ports are opened in the cone assembly allowing unimpeded flow of fluid from one cavity to the other.

Send for Bowen Technical Manual No. 4100 which includes complete descriptions of construction, operation, maintenance, and parts listing for the Bowen Super Fishing Jar.

Bowen Super Fishing Jar

Super II Fishing Jars

Bowen Super II Fishing Jars

Sold Export Only

The **NOV Downhole Bowen Super II Fishing Jar** is a straight pull operated jar which employs a patented combination of proven principles of hydraulics and mechanics. This jar is simple to assemble and its unique design allows for easy operation. No setting or adjusting is required before going into the hole, or after the fish has been engaged.

The Bowen Super II Fishing Jar is designed to permit the operator to easily and simply control the intensity of the jarring blow within a wide range, from a very light impact to a blow of very high impact. The unique impact control of the Bowen Super II Fishing Jar is made possible by the metering action of the patented cone assembly. As pull is applied to the jar, oil is forced from one side of the cone to the other through a metering slot. By being forced through a restricted passage, the fluid flow is retarded in such manner that the stroke is delayed until the operator has ample time to take the necessary stretch in the running string (and Super II Intensifier, when it is used) to strike a blow of given impact.

Features

The Super II Fishing Jar is a new design which incorporates many new design features. This is the next generation of fishing jar. Bowen is committed to continually upgrading our equipment, allowing our customers the versatility that is required in today's market.

The Super II Fishing Jar has been designed to be more rugged and dependable than our existing line of fishing jars. It incorporates a new one-piece mandrel design which gives the tool more torque and bending strength. All this adds up to greater impact loads being applied to the fish with less risk of tool failure or damage. The Super II Fishing Jar incorporates the same easy closing or resetting features found in the other Bowen Fishing Jars.

Send for Bowen Technical Manual No. 4102 which includes complete descriptions of construction, operation, maintenance, and parts listing for the Bowen Super II Fishing Jar.

Jar Intensifiers

Bowen Jar Intensifier® Tools

Sold Export Only

The **NOV Downhole Bowen Jar Intensifier** is run in conjunction with the Bowen Jar; either the Bowen Type Z Oil Jar, older Hydraulic Rotary Jar, or Super and Super II Fishing Jars. Its function is to supply acceleration to the upper end of the Jar and lower portion of the work string during the jarring stroke.

Each Bowen Jar Intensifier is designed to match a corresponding Bowen Rotary Jar. The Intensifier is essentially a fluid spring that stores energy when a strain is pulled on the running string. When the strain is removed by the free stroke of the Jar, the stored energy is released, accelerating the drill collars and jar end upward until a blow of high impact is struck.

The Bowen Jar Intensifier is completely safe to assemble, use and maintain, since no high pressure pre-loading is required.

The Intensifier is particularly valuable in deep, crooked holes where much of the stretch of the string is lost in friction. The tool is equally valuable at very shallow depths where very little stretch is available due to the short working string. Excessive numbers of drill collars should not be used when the Intensifier is in use.

A secondary advantage of the tool is its ability to absorb much of the shock of the rebounding string after the jarring stroke, protecting tools and string from damage. Full torque may be transmitted through Intensifier at all times, and full circulation may be maintained through the tool. Operation of the tool is very simple, requiring only straight pull, as rapidly or as slowly as required by the operation.

NOTE: Use only Bowen Intensifier Fluid in this tool. Other fluids will not work and will cause damage to the tool.

RECOMMENDED SPARE PARTS:

- (1) 10 Piston Packing Sets
- (2) 1 Washpipe
- (3) 4 Mandrel Body Fill Plugs
- (4) 2 Middle Body Fill Plugs
- (5) 6 Packing Sets
- (6) 16 Non-Extrusion Rings
- (7) 16 Seal Protector Rings
- (8) 4 Mandrel Body Seal Sets
- (9) 6 Refills of Intensifier Fluids

Bowen Jar Intensifier

Send for Bowen Technical Manual No. 4019 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Jar Intensifier.

Super II Intensifier® Tools

Bowen Super II Intensifiers

The **NOV Downhole Bowen Super II Intensifier** is run in conjunction with the Bowen Super or Super II Fishing Jar. Its function is to supply intensified impacts during jarring operations. Each size of Bowen Super II Intensifier is designed to match a corresponding size of Super and Super II Fishing Jar. The Intensifier is essentially a fluid spring which stores energy when a strain is pulled on the fishing string. When the strain is removed by the free stroke of the jar, this stored energy is released, accelerating the drill collars upward until a blow of high impact is struck.

NOTE: The Bowen Super II Intensifier is completely safe to assemble, use and maintain, since no high-pressure pre-load is required. Full torque may be transmitted by the Intensifier at all times in either direction, and full circulation may be maintained through the tool.

Operation

The operation of the tool is very simple, requiring only straight pull, to the desired pull load of the jar below.

Features

The Super II Intensifier incorporates two new features that greatly improve its performance and dependability. Its design allows for a constant working oil volume during operation. The second feature is the design for thermal compensation. The patented design allows oil to move into an area in the tool when elevated temperatures cause the oil to expand. When the temperature is lowered the oil automatically returns to the oil chamber in the tool. This unique system assures full stroke length at rated load, and eliminates the danger of over-pressure due to thermal expansion of the fluid, while also compensating for any minor leakage which may occur.

Send for Bowen Technical Manual No. 4025 which includes complete descriptions of construction, operation, maintenance, and parts listing for the Bowen Super II Fishing Jar Intensifier®.

Jar Placement Program

The Need for Precise Jar Placement

The effectiveness of fishing jars depends not only on the design of the jar, but also on:

- 1 Placement of the jar in the fishing string
- 1 Fishing string design
- 1 Hole conditions
- 1 Description of fish

The difference in jar performance between proper and improper placement can be a factor of as much as 4. Simple rules of thumb for jar placement do not always work. Because the analysis of the mechanics of jarring is complex, a computer program is needed to precisely determine optimum jar placement.

The Importance of the Stress Wave Theory

The energy for jarring comes from the spring effect of the drill string when it is either stretched or compressed. When the jar trips, the sudden release of energy does not instantaneously go to the stuck point. Rather, the energy is transmitted by stress waves which travel at the speed of sound in metal. This energy transmission is further complicated by the following:

- 1 Stress waves are partially transmitted and partially reflected at any change in drill string cross-section.
- 1 Friction between the drill string and hole acts to dissipate the stress wave's energy.

Sometimes moving the jar only a few feet up or down in the fishing string can drastically change how the stress waves add together to create jarring force on the stuck point.

The Impact Impulse Factor

To move a fish, the jarring force (impact load) must exceed the sticking force. How far the fish moves depends on the duration of the impact load. The combined effect of impact load and duration is called impulse.

Optimum jar placement occurs with the largest impulse for an impact load greater than the sticking force.

The NOV Downhole Solution

NOV Downhole has spent many years perfecting jar placement computer programs to offer our customers optimum results in jarring operation.

Our Fishing Jar Placement Program functions exclusively with Bowen fishing tool products to assure you of precision in determining your jar placement alternatives.

Features and Advantages of the NOV Downhole Fishing Jar Placement Program

- 1 Stress wave analysis techniques which track all stress waves.
- 1 Unlimited number of section changes are allowed, enabling the modeling of virtually any drill string and bottom hole assembly.
- 1 Effects of hole angle, hole curvature, and frictional drag are included.
- 1 Suitable for analysis of straight, directional, and horizontal holes.
- 1 Uniquely designed to model all Bowen Jars and Intensifiers
- 1 Separate programs for drilling and fishing to allow appropriate data input and output results in field usable terms.
- 1 Rapid solutions on personal computers for office or in the field use.
- 1 Offered as a service for customers.
- 1 Years of proven success in all types of field applications.

Fishing Jar Placement Program Mini CD

Surface Bumper Jars

Bowen Surface Bumper Jars

Sold Export Only

The **NOV Downhole Bowen Surface Bumper Jar** is designed to be installed in the drill string at the surface during fishing operations which require downward jarring impacts against a fish at the point where it is stuck. By a simple adjustment it may be set to vary the jarring force. The stroke of the tool is 48 inches, allowing the fish to be hammered down much farther than could be done with a conventional rotary jar. This tool provides many other outstanding advantages.

It is unique in that it is used only on the surface to release a stuck fish. Due to this intermittent usage, the service life of this tool is greatly extended when compared with conventional bumper subs.

The Bowen Surface Bumper Jar may be used to great advantage where the downhole drilling, fishing or washover running string becomes stuck, and a heavy downward force is required to release it. It is often used to free keyseated drill pipe and drill collars, and to initiate abrupt jarring impacts down the string to actuate Drilling Bumper Subs, Bumper Safety Joints and other similar downhole bumping tools. It is also useful for transmitting very heavy downward forces to release grappling tools such as Overshots or Spears when the grapples or slips have become imbedded in the fish or have become fouled due to repeated and prolonged downhole jarring. In many instances it has been successfully used where all previous methods have failed.

Full torque may be utilized in either direction, and full circulation may be maintained through the tool during its operation.

Basically, the Bowen Surface Bumper Jar consists of a hexagonal Mandrel Assembly working in a Bowl Assembly. The length of the stroke is important since, when using the tool, it is not necessary that the two striking surfaces meet as with conventional downhole jarring tools.

RECOMMENDED SPARE PARTS:

- (1) 2 Washpipes
- (2) 1 Seal Insert
- (3) 1 Friction Mandrel
- (4) 1 Control Ring
- (5) 1 Friction Slip
- (6) 1 Control Ring Plug
- (7) 4 Non-Extrusion Rings
- (8) 4 Seal Protector Rings
- (9) 6 Packing Sets

Bowen Surface Bumper Jar

Junk Baskets

Bowen-Itco Junk Baskets

The **NOV Downhole Bowen-Itco Junk Basket** is a rugged junk fishing device, using either a Mill Shoe or Flat Bottom Type Shoe in conjunction with two sets of free revolving finger type Catchers.

Construction

The catchers are of rivetless construction. They may be easily redressed on the job, eliminating the necessity of returning them to the shop for replacement. The upper catcher is designed to effectively break the core that is cut by the shoe. The fingers extend only halfway to the center. The lower catcher has alternately short and long fingers which extend almost to the center of the tool to effectively collect and retain odd pieces of junk or cores.

This Junk Basket may be easily converted to a fishing magnet by replacing the catchers with a Bowen magnet insert.

Alternate Mill Shoes available are Type B and Type C. The Type B is similar to Type A in design but with Itcoloy dressing. The Type C is flat bottomed and dressed with Itcoloy.

Operation

Operation of the Itco Junk Basket is simple, requiring only slow rotation and circulating fluid, to retrieve junk, cores or both simultaneously.

RECOMMENDED SPARE PARTS:

- (1) 2 Upper Catchers
- (2) 2 Lower Catchers
- (3) 2 Mill Shoes

Send for Bowen Technical Manual No. 3050 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen-Itco Junk Baskets.

Junk Baskets

Bowen Reverse Circulation Junk Baskets

The **NOV Downhole Bowen® Reverse Circulation Junk Basket** is used to retrieve all types of small junk objects in well bores. This tool's unique principle of reverse circulation insures complete recovery of all junk and eliminates mis-runs. A drain through the tool also eliminates the possibility of pulling a wet string even though the inner barrel is plugged by the core. In addition, it may be converted into an effective fishing magnet and still retain the reverse circulation feature.

A single junk catcher is used in each assembly. A lifting sub is provided for ease of handling which includes a storage space for the steel ball used in the operation of the tool. It is converted into a fishing magnet by replacing the catcher with the Bowen magnet insert.

Alternate Shoes available are the Type B and Type C. The Type B shoe is similar in design to Type A but dressed with Itcoloy. The Type C is flat bottomed and dressed with Itcoloy.

During operation, with the steel ball dropped into the valve seat, fluid flows through the inner passage of the barrel and out the vents in its lower end. The fluid is directed outward and downward and deflected toward the center. Fluid flows in a continuous stream to the center of the tool and up through return ports in the upper end of the barrel. All junk is thus carried into the barrel above the junk catcher.

RECOMMENDED SPARE PARTS:

- (1) 2 Junk Catchers
- (2) 2 Mill Shoes
- (3) 1 Valve Cup
- (4) 1 Valve Seat
- (5) 1 Steel Ball

AVAILABLE ACCESSORIES:

- (1) Finger Shoes

Junk Baskets

Bowen Full-Flow Reverse Circulation Junk Baskets

The **NOV Downhole Bowen® Full-Flow Reverse Circulation Junk Basket** is similar to the standard Reverse Circulation Junk Basket and is also used to retrieve small junk objects in well bores. The difference is that the Full-Flow type has a unique valve assembly which allows circulation through the center to keep out shale or debris while running in the hole. A drain through the tool eliminates the possibility of pulling a wet string even though the inner barrel is plugged by the core.

Two Junk Catchers are used in each assembly. A Lifting Sub is provided for ease of handling which includes a storage space for the steel ball used in the operation of the tool. It is also converted into a Fishing Magnet by replacing the catchers with a Bowen® Magnet Insert.

Alternate Shoes available are the Type B and Type C. The Type B shoe is similar in design to Type A but dressed with Itcoloy. The Type C is flat bottomed and dressed with Itcoloy.

Operation

During operation, the ball is dropped to the valve seat. Pump pressure then causes pins to shear which opens the reverse circulation cavity to circulation. Fluid flows through the inner passage of the barrel, out the vents in its lower end, outward and downward deflected toward the center in a continuous stream, and up through return ports in the upper end of the barrel. All junk is thus carried into the barrel above the junk catchers.

ACCESSORIES:

- (1) 2 Finger Shoes
- (2) 4 Finger Shoe Replacements
- (3) 1 Magnet Insert

RECOMMENDED SPARE PARTS:

- (1) 2 Junk Catchers
- (2) 2 Mill Shoes
- (3) 1 Ball Seat
- (4) 1 Ball Seat Retainer
- (5) 1 Steel Ball
- (6) 4 Valve Repair Kits
- (7) 2 Catcher Repair Kits (for each assembly)

Junk Subs

Bowen Junk Subs

NOV Downhole Bowen Junk Subs, which are normally run just above the drill bit, have a cup for catching objects too heavy to be completely circulated out of the hole. This is particularly advantageous in junk milling operations. By running a Bowen Junk Sub above a scraper, operators can get quicker, cleaner scraping jobs.

Construction

Bowen Junk Subs are constructed from high quality steel, completely stress-relieved after cup and rib guides have been welded to the main body.

Rib guides prevent the cup from becoming crushed and help guide the tool through tight places upon withdrawal from the hole. Junk Subs are available in standard, long and extra long types.

Fishing Magnets

Bowen Fishing Magnets

NOV Downhole Bowen Fishing Magnets are used to retrieve all types of small objects having magnetic attraction from bore hole bottoms. Such un-drillable objects as bit cones, bearings, slips, tong pins, and milling cuttings can often be retrieved only by magnetic attraction.

These Fishing Magnets are particularly valuable for use prior to diamond coring. In a single trip, the Bowen Fishing Magnet will completely clean the hole of these damaging junk items, insuring good performance and safeguarding the valuable bit.

Bowen Fishing Magnets may be run on wire lines or on pipe. Wireline operations have the advantages of speed and economy. Pipe operations have the great advantage of utilizing the generous circulation holes in the magnet to eliminate settlements above the fish, and to loosen the fish (see chart below). The first six assemblies (with sucker rod connections) do not have circulation bores.

Bowen has **Wireline Adapters** available to run between the magnet and cable head or rope socket. When ordering, specify the required top connection and the magnet to be used with. The **Flush O.D. Type Guide** is sold as part of the assembly.

Cut-Lipped and **Mill Type Guides** are available as optional accessories. Order by standard guide number, specifying type required and magnet to be used on.

RECOMMENDED SPARE PARTS:

- (1) 1 Lipped Guide
- (2) 1 Mill Guide

Itcoloy Milling Tools

Bowen Itcoloy Milling Tools

NOV Downhole Bowen Milling Tools, hard faced with Itcoloy, sintered tungsten carbide particles, are designed to mill away stuck fish that cannot be retrieved by conventional fishing methods. Their super penetration rates results in fewer round trips. They are highly resistant to impact loads and their self sharpening feature results in maximum useful life.

The Milling Tool selected should provide a maximum of milling edges to the material to be milled, maximum replacement of the milling edges as wear occurs, and maximum circulation to remove the cuttings.

Bowen Pilot Mills

Bowen Pilot Mills have been proven in the field to be well suited for milling liner hangers, eliminating inside cuts. They are also well suited for milling washpipe, safety joints, crossover swages, and washover shoes. All sizes available according to customer specifications.

RECOMMENDED FOR REDRESSING MILLS

- (1) Bowen Itcoloy 50 lbs.
- (2) Bowen Tinning Rod 10 lbs.
- (3) Bowen Brazing Flux 1 lb.

Send for Bowen Technical Manual No. 5100 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Milling Tools.

Rotary Shoes

Bowen Rotary Shoes Hard-Faced with Itcoloy

NOV Downhole Bowen Milling Shoes and Bowen Rotary Shoes dressed with Itcoloy are designed in various sizes and styles to meet the many conditions encountered in oil well fishing and washover operations. Illustrated are the various styles with an explanation of their intended service.

Shoe Types

Type A

Type A Rotary Shoe is used to cut metal on the fish without cutting the casing. Cuts on the inside diameter (I.D.) and the bottom. Does not cut on the outside diameter (O.D.).

Type B

Type B Rotary Shoe is used for washing over a fish and cutting metal or formation in the open hole. Cuts on the outside diameter (O.D.) and the bottom. Does not cut on the inside diameter.

Type C

Type C Rotary Shoe is used for washing over and cutting metal, formation, or cement. Cuts freely on the inside diameter (I.D.), the outside diameter (O.D.), and the bottom.

Type D

Type D Rotary Shoe is used to cut metal on the fish without cutting the casing where clearances are limited. Cuts on the inside diameter (I.D.) and the bottom. Does not cut on the outside diameter (O.D.).

Type E

Type E Rotary Shoe is used for washing over a fish and cutting metal, formation or cement in the open hole where clearances are limited. Cuts on the outside diameter (O.D.) and the bottom. Does not cut on the inside diameter (I.D.).

Type F

Type F Rotary Shoe is used to size and dress the top of a fish inside of the casing. Makes a tapered cut on the inside diameter (I.D.), and cuts on the bottom. Does not cut on the outside diameter (O.D.).

Type G

Type G Rotary Shoe is used for washing over and cutting metal, formation or cement in the open hole with limited inside clearances. Cuts on the inside diameter (I.D.), the outside diameter (O.D.), and the bottom.

Type H

Type H Rotary Shoe is used for washing over and cutting metal in the open hole with limited clearance on the outside diameter (O.D.). Cuts on the inside diameter (I.D.), the outside diameter (O.D.) only.

Type I

Type I Rotary Shoe is used for washing over and cutting formation only. Mill tooth design permits maximum circulation. Cuts on the bottom only. Does not cut on the outside diameter (O.D.) or inside diameter (I.D.).

Type J

Type J Rotary Shoe is used for washing over and cutting formation only. Mill tooth design with side wings permits maximum circulation. Cuts on the bottom and on the outside diameter (O.D.). Does not cut on the inside diameter (I.D.).

Type K

Type K Rotary Shoe is used for washing over and cutting on the bottom face only. Does not cut on the outside diameter (O.D.), or the inside diameter (I.D.).

Bowen also supplies all necessary components for washover operations:

- ▮ **Washpipe** — all grades, sizes, and connections.
- ▮ **Lift Plugs** — for all connections. furnished with or without bail.
- ▮ **Drive Subs** — for crossover from drill string to washpipe. Available in all connections as plain or long type with elevator recess.

Send for Bowen Technical Manual No. 5100 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Milling Tools.

Itcoloy

Bowen Itcoloy

NOV Downhole Bowen Itcoloy is used to form the cutting or milling surfaces on milling shoes, rotary shoes, junk mills, section mills, milling stabilizers, piloted liner mills, etc.

Bowen Itcoloy contains the maximum desired concentration of selected, crushed sintered tungsten carbide particles imbedded in a resilient nickel-silver alloy matrix. The carbides used are all steel cutting grades with a hardness of 91 to 93 Rockwell "A." The matrix is specially compounded and has a tensile strength of 100,000 psi. Bowen Itcoloy is packed in cartons of approximately 10 pounds each and is available in several graded sizes.

Bowen Itcoloy

Part No.	Nominal Size	Graded Particle Size	Rod Size	Approximate Weight Per Rod
145723	3/8	3/8 - 1/4	3/8 x 3/8 x 18	14 7/8 oz.
145722	5/16	5/16 - 1/4	5/16 x 3/8 x 18	12 oz.
145720	3/16	3/16 - 1/8	1/4 x 3/16 x 18	10 9/8 oz.
145721	1/8	1/8 - 1/16	1/4 x 3/16 x 18	9 1/2 oz.
145728	10 - 18	10 - 18 Screen Mesh	1/4 x 3/16 x 18	7 1/4 oz.
145726	18 - 30	18 - 30 Screen Mesh	3/16 x 3/16 x 18	5 1/2 oz.
145727	30 - 45	30 - 45 Screen Mesh	3/16 x 3/16 x 18	5 1/2 oz.

Tinning Rod and Brazing Flux

Bowen Tinning Rod is a specially compounded flux-coated, nickel-silver brazing Alloy particularly suited as a base for Bowen Itcoloy. Bowen Tinning Rod produces a corrosion-resistant weld deposit with a tensile strength of 100,000 psi and a hardness of 160 170 Brinell. Tinning Rod is packed in cartons of approximately ten pounds each. Bowen Tinning Rod should be ordered in quantities approximating 20 percent of the Bowen Itcoloy order

Bowen Brazing Flux is a specially compounded braze-welding flux to prepare the surface of the base metal for the application of Bowen Tinning Rod and Bowen Itcoloy. Bowen Brazing Flux is packed in cans of approximately one pound each. Bowen Brazing Flux should be ordered in quantities approximating two percent of the Bowen Itcoloy order.

Send for Bowen Technical Manual No. 5100 that completely describes Itcoloy and its application.

Brazing Flux — Part No. 145725

Tinning Rods — Part No. 145719

Ditch Magnets / Magnet Chargers

Bowen Ditch Magnets

The NOV Downhole Bowen Ditch Magnet is the best available and most effective means of trapping and removing metal particles from the drilling mud that the shale shaker will not get. This unit will capture all metals having magnetic attraction and hold them until they can be removed from the mud stream. The Magnet is particularly valuable during milling operations. Removal of mill cuttings and debris reduces wear of mud pumps and other equipment, as well as eliminating problems caused by the return downhole of harmful debris. They are equally effective during washover and fishing jobs.

Construction

The Bowen Ditch Magnet features simplicity, ruggedness and high power-to-weight ratio. The 36-inch long Magnet weighs only 90 pounds and will hold in suspension as much as half this weight of mill cuttings. The design is clean; eliminating trays, gates and other auxiliary equipment. The magnet is encased in stainless steel and has integral handles at each end for lifting.

Operation

No special instructions are required to operate the Bowen Ditch Magnet. It is most effective when suspended by soft line in the mud ditch. It may also be suspended by soft line in the shaker discharge. The unit should be cleaned several times per day, depending on milling rate. Just remove the Magnet and clean with fresh or salt water hose. Wipe all cuttings from the unit and return it to duty. The unit may be cleaned less often during other operations when return cuttings come slower.

Bowen Magnet Chargers

The Bowen Magnet Charger is designed to induce a strong magnetic charge into bar type fishing magnets. It is able to do big charging jobs with small electrical service. The Bowen Magnet Charger is a pulsed type unit and requires much less electrical power than ordinary continuous type chargers.

The Bowen Magnet Charger includes a Power Supply Unit and Magnetizing Coil Unit. The solid state Power Supply Unit converts alternating current input into short pulse, high-peak direct current output to the Magnetizing Coil.

Operation

The magnet is placed in the Magnetizing Coil and locked into place by means of adjustable arms which are a part of the magnetic circuit. A push of the button on the Power Supply Unit starts the magnetizing cycle, which automatically shuts off after the short interval of time required to reach peak magnetizing force. The Bowen Magnet Charger can be used to magnetize fishing magnets up to 14- and 20- inch outside diameters.

Hydraulic External Cutters

Bowen Hydraulic External Cutters

NOV Downhole Bowen Hydraulic External Cutters are hydraulically actuated mechanical tubing and drill pipe cutters. The cutters provide fast, efficient, smooth cutting and are capable of cutting and recovering strings of tubing or drill pipe. The cutter knives are fed entirely by pump pressure, thus giving the operator sensitive control.

Construction

Simple, yet rugged, Bowen Hydraulic External Cutters are composed of a top sub, body, guide, a set of knives, and a segmented piston assembly. Two shear pins hold the piston in a "running in" position until they are sheared to begin the cut. The piston assembly is composed of a rubber ring and a set of interlocking, conical piston segments. The segments are held in a contracted position by a tough rubber ring stretched around the end of the segments in a suitable groove. Each piston segment has a fluid passage which is engineered to simultaneously pass fluid for flushing, cooling, and restricting the fluid flow for ample pumpdown force on the knives to effect the cut.

Operation

To operate, assemble the cutter using the proper size and type of piston assembly. Run the cutter into the hole to cutting depth. When cutting depth is reached, open the fill-up and standpipe valves just enough to shear the shear pins. Begin slow rotation — 15 to 25 rpm. Slowly close the bypass valve again to pump fluid down the working string. This will begin feeding the knives to start the cut. The amount of pressure and gallons per minute required depends on the cutter size and piston assembly being used. Use extreme caution to avoid surging of pump pressure when starting a cut. Pressure surging causes the string length to contract and expand, moving the cutter up and down. This motion prevents the knives from remaining in one position when starting a cut. A rough chattering action followed by the smoothing of the rotary will signal the completion of the cut. Bring the cut section out and strip it from the washpipe. Do not spud coming out of hole.

RECOMMENDED SPARE PARTS:

- (1) 1 Set Piston Segments
- (2) 1 Feed Ring
- (3) 24 Shear Pins
- (4) 6 Sets Knives
- (5) 2 Sets of Knife Pins
- (6) 1 Set Knife Pin Screws
- (7) 6 Rubber Rings
- (8) 6 Piston O-Rings

Send for Bowen Technical Manual No. 5550 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Hydraulic External Cutters.

Internal Cutters

Bowen Internal Cutters

NOV Downhole Bowen Internal Cutters are simple, efficient tools for cutting tubing, casing or drill pipe. They are available in sizes for cutting 1½" tubing up to 20¾" casing. Manufactured to exacting standards, Internal Cutters permit the redressing of a basic assembly in order to cut alternate sizes of pipe. Internal Cutters are used to cut tubing, casing or drill pipe. They may be run on sucker rods, macaroni strings, tubing, or drill pipe, depending upon the diameter of the pipe to be cut.

The Internal Cutter consists of a Wiper Block (or a Drag Spring) Assembly to accomplish setting in the pipe; Slips and Cone Assembly to anchor the tool; a Main Spring to assist in maintaining uniform feed to the Knives; wedge-like Knife Blocks to drive the Knives upward and outward to engage the pipe; and hardened and ground Knives for easy, efficient cutting.

An important feature of the Internal Cutter is the "Automatic Bottom." This device permits the operator to set the cutter at any desired depth, to release the tool and to reset at another depth, all without coming out of the hole.

Bowen Collar Finders

Bowen Collar Finders (not shown), assembled at the bottom of a Cutter, enable the operator to locate the nearest collar to the cutting depth. Construction permits free lowering into pipe. When the assembly is raised, the upper ends of the Collar Locators engage the space between two joints of pipe. Additional upward pull snaps the Shear Pin; the reaction in the string is very apparent at the surface and the operator then knows the exact location of the collar.

RECOMMENDED SPARE PARTS:

- (1) 6 Sets of Knives
- (2) 2 Sets of Knife Pins
- (3) 6 Sets of Knife Springs
- (4) 2 Sets of Knife Spring Screws
- (5) 1 Set of Slips
- (6) 1 Set of Wiper Blocks
- (7) 1 Set of Wiper Block Springs
- (8) 1 Set of Wiper Block Screws
- (9) 1 Set of Grip Jaws
- (10) 1 Set of Grip Jaw Springs
- (11) 1 Wickered Sleeve
- (12) 1 Set of Drag Springs
- (13) 1 Set of Drag Spring Screws

Internal Pressure Pipe Cutters

Bowen Internal Pressure Pipe Cutters

The **NOV Downhole Bowen Internal Pressure Pipe Cutter** is a simple hydraulic actuated pipe cutter, consisting of a Body, with multiple Knives and Knife Pins: actuated by a Piston with a Pressure Relief Valve System consisting of a Flow Bushing, Valve Stem, Flow Bean Retainer, Valve Stop Spider, Flow Bean, and Set Screws.

Operation

The Cutter is attached to the drill pipe or tubing. The knives are wired to retain them in the groove and lowered to the desired depth. Rotation is started (usually 30 to 50 rpm). The pump is turned on, usually to 900 psi. The cutter is held in one position while cutting, and the piston forces the knives through the pipe. When the knives reach the preset diameter, the piston will separate from the valve stem and provide more mud flow through the tool, causing a marked decrease in pump pressure, indicating the knives have severed the pipe.

The pump pressure indication is preset by a simple adjustment, allowing the knives to extend at exactly the desired diameter.

Send for *Bowen Technical Manual No. 5680* which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Internal Pressure Pipe Cutters.

External Cutters

Bowen External Tubing and Drill Pipe Cutters

NOV Downhole Bowen External Cutters are automatic springfed cutters that provide fast, efficient, external cutting and recovery of long sections of tubing, drill pipe or casing. The spring-fed feature prevents excessive strain from being applied from the rig floor, which could cause the knives to burn or break before the cut is made.

The Body of the Bowen External Cutter is designed so that when an upward strain is taken on the cutting string (and the Spring Dog Assembly has engaged a tool joint or collar), the downward travel of the Spring Dog Assembly and the Thrust Washer is limited to compressing the Main Spring and to shearing the Feed Ring Shear Pin. Thereafter the Knives are fed for the cutting operation only by the Main Spring. A Thrust Bearing Assembly assures smooth, low friction rotation of the cutter.

The Spring Dog is designed to catch under the coupling to actuate the cutter and retain the cutoff section of the pipe. It is effective for use with couplings, collars or squared shoulder tool joints. It is standard and will be furnished unless an alternate optional catcher assembly is specified. The optional Ratchet Pawl Assembly is used if the pipe being cut has external upset integral tool joints. This assembly may also be used with couplings.

The optional Slip Assembly is used if the pipe to be cut has external flush tool joints. The Slips will grip the pipe at any point in its length to actuate the cutter and retain the cut-off section of pipe. Bowen External Cutters are available to cut all popular sizes of drill pipe and tubing. Special sizes will be furnished on special order.

RECOMMENDED SPARE PARTS:

- (1) 1 Feed Ring
- (2) 24 Shear Pins
- (3) 6 Sets Knives
- (4) 2 Sets Knife Pins
- (5) Set Screws
- (6) Spring Dog Assemblies

Send for **Bowen Technical Manual No. 5500** which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen External Cutters.

Tubing and Casing Patches

Bowen Packer-Type Tubing and Casing Patches

NOV Downhole Bowen Packer-Type Patches are external catch tools, designed to engage a previously prepared Fish, pack it off, and become a permanent part of the repaired tubing, pipe, or casing string.

The same dependable method of engagement and release which is used for Bowen Overshots is employed in Bowen Packer-Type Casing Patches. These Patches feature positive engagement and positive seal-off in either direction, providing a permanent, rigid connection which will remain leak proof for years, yet it may be easily released if ever the need arises.

Bowen Packer-Type Casing Patches will not restrict the bore of the casing or tubing in any manner, and are as strong as the string being repaired. They are available in all popular sizes from 3/4" standard pipe through 24" casing. Non-standard Patches will be furnished on special order for any size pipe or casing at extra cost.

High Pressure Packer-Type Casing Patches are available upon request.

Send for Bowen Technical Manual No. 6300 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Packer-Type Casing Patches.

Bowen Lead Seal Tubing and Casing Patches

NOV Downhole Bowen Lead Seal Casing Patches are particularly well suited for service in wells which contain fluids and gases which are harmful to synthetic rubber packers. The seals used are compression type, multiple lead rings. These seals are cast from commercially pure (unalloyed) lead, which is fully annealed for uniformity of flow and to minimize the setting load required to set them.

The same method of engagement (and release) is utilized as in the Packer-Type Casing Patch. When engaged, an upward strain causes the outer assembly to move upward while the engaged

grapple, carrier and control remain stationary. Compression between the carrier and guide causes the lead seals to flow around the tubing or casing, forming a highly effective seal.

Special sizes, left-hand tools, left-hand connections, or oversize O.D.s will be furnished on special order at extra cost. Send for Bowen Technical Manual No. 6400 which includes complete descriptions of Bowen Lead Seal Casing Patches.

Send for Bowen Technical Manual No. 6400 which includes complete descriptions of Bowen Lead Seal Casing Patches.

Casing Patches

Bowen Lead Seal Cementing Casing Patches

NOV Downhole Bowen Lead Seal Cementing Casing Patches are designed to form a permanent sealed connection between two strings of tubing or casing and cement them together in a single run. These Patches incorporate the proven Bowen compression-type multiple lead seal assembly and a valving method which allows it to be cemented in place immediately after it is set. The primary seals are cast from commercially pure lead, which is impervious to most well fluids and gases. These seals are effective in temperatures up to 550°F. These Casing Patches are very simple to operate. The Patch is assembled, attached to the running string and lowered over the washed over string. The running string is lifted, allowing the outer body parts to move up-hole while the Grapple and Carrier remain in position. This compresses the Lead Seals, forming an initial seal.

The running string is then lowered, telescoping the carrier and stinger upward in the outer body parts and opening the valve formed between the integral lower seal and the stinger. Cement is immediately pumped through this valve, cementing the Patch and running string in place. After cementing, a moderate pull is again applied to the running string and maintained during the cement curing interval.

Send for Technical Manual No. 6460 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Lead Seal Cementing Casing Patches.

Bowen Underwater Wellhead Casing Patches

NOV Downhole Bowen Underwater Wellhead Casing Patches are engineered to allow casing to be salvaged during landing operations that would otherwise necessitate expensive underwater washover and pulling operations. Bowen Underwater Wellhead Casing Patches are essentially the same as the standard Bowen Packer Type Casing Patch, with the added feature of a long Top Extension. Casing Patches are available in a complete range of sizes from 5½" through 13⅝" casing. Additional sizes to meet specific requirements will be made on special order. The Top Extension is manufactured from casing where practical to reduce cost to a minimum. Where hole sizes will not permit the inexpensive extension, alloy tubing is used. In most cases, extensions are available in any required length.

Sometimes during landing operations the casing being landed gets stuck off bottom. If this happens while the casing is being floated down in cement, an expensive and time consuming fishing job could result. In place of conventional fishing, the operation may be salvaged by using a Bowen Casing Patch in the following manner. The first collar below the wellhead may be located and the casing cut. The upper portion of the casing is removed from the well. The remaining portion of the casing is engaged and packed off, and is then engaged with a Bowen Releasing Spear and pulled up into the path a sufficient distance to insure proper tension in the casing string.

Send for Bowen Technical Manual No. 6480 which includes complete descriptions of construction, operation, maintenance, and parts listing for Bowen Underwater Wellhead Casing Patches.

Casing Patches

Bowen High Pressure Casing Patches

The Bowen High Pressure Casing Patch is an external catch tool, designed to engage a previously prepared fish, pack it off, and become a permanent part of the repaired casing, pipe or tubing.

The same dependable method of engagement and release which is utilized for Bowen Overshots is employed in the Bowen High Pressure Casing Patch. This method assures positive engagement and a positive seal from either direction. The Patch provides a permanent connection, which remains rigid and leak-proof for many years yet it can be released if ever the need arises.

Bowen High Pressure Casing Patches will not restrict the bore of the casing or tubing in any manner.

The Bowen High Pressure Casing Patch is composed of three outside parts and five internal parts. This simplicity of design is matched by the simple operation.

Operation

The Bowen High Pressure Casing Patch as indicated is used to repair a damaged casing string by replacement of the damaged section, without having to remove the entire string of casing from the hole.

Where the upper portion of a casing string becomes ruptured or disoriented from the lower portion such as by faulting or caving of the formation, crushing, rupture, or backing off, the upper portion must be removed. New casing is then replaced, the Bowen High Pressure Casing Patch forming the patching means between the old and new strings.

Construction

The Bowen High Pressure Casing Patch is constructed in the most basic manner to perform the functions of engaging the fish, sealing off the fish, or releasing, either during or after setting operations, should this become necessary.

New High Pressure Casing Patch sizes are being designed and may not be on this list. Call sales for updated information.

Casing Scrapers

Bowen Casing Scrapers

The **NOV Downhole Bowen Casing Scraper** is ideal for the removal of mud, cement, bullets, rust, scale, paraffin, perforation burrs and other obstructions from the inside walls of casing.

Maintaining a clean casing I.D. is important when operating drilling, fishing, or wireline tools. Likewise, packers, patches, spears, and similar tools require clean surfaces to grip. Obstructions on casing walls will frequently cause these tools to fail or become difficult to operate.

Construction

Utilizing a simple one-piece mandrel design, the Bowen Casing Scraper is constructed to be rugged, yet simple to operate and maintain. The Scraper conditions 50 percent more surface area than any other tool on the market. The full circle blades are so spaced to contact 600° (almost two complete circles) of casing surface at once.

Short and compact, the Scraper also incorporates a long taper on the blades for passing through joints without hanging. The Scraper works in vertical or rotary operations and may be run on drill pipe or wireline.

Bowen Casing Scrapers are available to condition pipe ranging from 2 $\frac{3}{8}$ -inch tubing to 13 $\frac{3}{8}$ -inch casing. For more information on the use, operation and specifications of the Scraper contact your National Oilwell Varco representative.

Advantages

- ▮ More scraping surface approximately 50 percent more than any other scraper on the market extends blade life.
- ▮ Full circle blades contact 600° surface at once.
- ▮ Short, compact, easy to assemble and disassemble.
- ▮ Longer guide taper on blades for passing through joints without hanging.
- ▮ Vertical and rotary operation may be run on wireline or drill pipe.
- ▮ Investment cast tool steel blades allows maximum scraping ability.

Send for *Bowen Technical Manual No. 6255* which includes complete descriptions of construction, operation, maintenance, and parts listing for the Bowen Casing Scraper.
